

POULTRY

Between two batches (when the whole flock is removed) :

- On bare ground, before laying straw : **300g to 500g/m²** depending on wetness and crusting of the floor

During a batch :

- On soiled bedding before mulching fresh straw : **300 to 500 g/m²**
- On slatted floor : **100 g/m², 1 to 2 times / week**

In prevention of heat stroke :

- On soiled bedding : **500g/m² in the morning to reduce fermentations**

On spoil conveyor or pit :

- **250g/m² or per linear meter**

Recommended amount for a batch in a building of 1000 m²

- **300 Kg for sanitary emptying + 75 Kg with the presence of animals (on 250 m² of free space between the chickens) = 375 Kg**

What quantity of BIOSUPER should I use for 1 month ?

	Surface area of the building	Amount by m ²	Total amount
For sanitary emptying = (Surface area of the building)	×	300g/m ²	=
Species (laying hens, turkeys...)	×	100 or 150 or 250 g/m ²	=
